Self-dispersing pigment preparations

Heubach has launched a range of self-dispersing pigments which can be mixed into the coating system simply by stirring them in, like instant coffee. This means that in most applications there is no longer any need for the usual laborious milling of pigments. “Autosperse” is a low-dust powder with universal applicability in powder coatings and solvent-based binder systems. It is compatible with hydrocarbon resins, air-drying and oven-drying alkyd resins, urea and melamine aldehyde resins, nitrocellulose, acrylates, vinyl chloride copolymers and epoxy resins. The pigment preparations make it possible to combine low manufacturing costs with high brilliance, saturated colours and hiding power. They also have good fastness to light and weathering resistance. The pigments are available in opaque shades of the yellow, orange and red colour range.
